| <b>13</b> | <b>howto flash your zephyr image</b>   | <b>27</b> |
| <b>14</b> | <b>howto generate pdf documents</b>    | <b>29</b> |

this document describes the installation of zephyr RTOS on the PineTime smartwatch.

<https://wiki.pine64.org/index.php/PineTime>

It should be applicable on other nordic nrf52832 based watches (Desay D6....).

the approach **in** this manual **is** to get quick results :

- minimal effort install
- **try** out the samples
- inspire you to modify **and** enhance

**suggestion :**

- install zephyr, <https://docs.zephyrproject.org>
- copy the board definition
- try some examples
- try out bluetooth
- try out the display

## ABOUT

I got a pinetime development kit very early.

I would like to thank the folks from <https://www.pine64.org/>.

I like to hack stuff, and I like the idea behind Open Source.

The smartwatches I hacked, contained microcontrollers from Nordic Semiconductor.

A lot of resources exist for this breed.

It is an Arm based, 32bit microcontroller with a lot of flash and RAM memory.

In fact it is a small computer on your wrist, with a battery and screen, and capable of bluetooth 4+ wireless communication.

A word of warning: this **is** work **in** progress.  
You're likely to have a better skillset than me.  
You are invited to add the missing pieces **and** to improve what's already there.

## 1.1 Todo

list with suggestions:

- better graphics (lvgl using images and rotating stuff)
- NOR flash (here one can store data)
- watchdog
- DFU (update over bluetooth)
- acceleration sensor
- heart rate sensor
- fun stuff
- useless stuff, but somehow cool
- applications, e.g. calculator, cycle computer, step counter, heart attack predictor ...

## 1.2 Fast track

In this repository you can find modified directories, which you can copy to the zephyrproject directory:

- pinetime (board definition -> boards/arm)

- st7789v (example -> samples/display)
- blinky (example -> samples/basic)

## INSTALL ZEPHYR

[https://docs.zephyrproject.org/latest/getting\\_started/index.html](https://docs.zephyrproject.org/latest/getting_started/index.html)

the documentation describes an installation process under Ubuntu/macOS/Windows

I picked Debian (which is not listed) . . . and soon afterwards ran into trouble

*this behaviour is known as : stubborn or stupid, but I remain convinced it could work*

But even after following the rules, I got a problem with the `dtc` (device tree compiler)

- I solved this by creating a link from the development-tools to `/usr/bin/dtc` (here you need to make sure you got a very recent one)

```
cd /root/zephyr-sdk-0.10.3/sysroots/x86_64-pokysdk-linux/usr/bin/  
mv dtc dtc-orig  
ln -s /usr/bin/dtc dtc
```

**Note :** in order to get the display `st7789` Picture-Perfect, you might need a zephyr patch

have a look at : <https://github.com/zephyrproject-rtos/zephyr/pull/20570/files> You will find them in this repo under `patches-zephyr`.

## ZEPHYR ON THE PINETIME SMARTWATCH

### 3.1 Blinky example

**Note:** I think you need to connect the 5V, just connecting the SWD cable (3.3V) is likely not enough to light up the leds

The watch does **not** contain a led **as** such, but it has background leds **for** the LCD.  
Once lit, you can barely see it, cause the screen **is** black.

```
copy the board definition for the pinetime to the zephyrproject directory
$ cp (this repo)pinetime ~/zephyrproject/zephyr/boards/arm/pinetime

replace the blinky sample with the one in this repo
$ cp (this repo)blinky ~/zephyrproject/zephyr/samples/basic
```

have a look at the pinetime.dts file, here you see the definition of the background leds.

```
gpios = <&gpio0 14 GPIO_INT_ACTIVE_LOW>;
gpios = <&gpio0 22 GPIO_INT_ACTIVE_LOW>;
gpios = <&gpio0 23 GPIO_INT_ACTIVE_LOW>;
```

*building an image, which can be found under the build directory*

```
$ west build -p -b pinetime samples/basic/blinky
```

once the compilation is completed you can upload the firmware ~/zephyrproject/zephyr/build/zephyr/zephyr.bin

## BLUETOOTH (BLE) EXAMPLE

### 4.1 Eddy Stone

**Note:** compile the provided example, so a build directory gets created

```
$ west build -p -b pinetime samples/bluetooth/eddystone
```

this builds an image, which can be found under the build directory

I use linux with a bluetoothadapter 4.0. You need bluez.

```
#bluetoothctl  
[bluetooth]#scan on
```

And your Eddy Stone should be visible.

If you have a smartphone, you can download the nrf utilities app from nordic.

### 4.2 Ble Peripheral

this example is a demo of the services under bluetooth

first build the image

```
$ west build -p -b pinetime samples/bluetooth/peripheral -D CONF_FILE="prj.conf"
```

the image, can be found under the build directory, and has to be flashed to the pinetime

with linux you can have a look using bluetoothctl

```
#bluetoothctl  
[bluetooth]#scan on  
  
[NEW] Device 60:7C:9E:92:50:C1 Zephyr Peripheral Sample Long  
once you see your device  
[blueooth]#connect 60:7C:9E:92:50:C1 (the device mac address as displayed)  
  
then you can already see the services
```

same thing with the app from nordic, you could try to connect and display value of e.g. heart rate

## 4.3 using Python to read out bluetoothservices

In this repo you will find a python script : readbat.py In order to use it you need bluez on linux and the python *bluepy* module.

It can be used in conjunction with the peripheral bluetooth demo. It just reads out the battery level, and prints it.

```
import binascii
from bluepy.btle import UUID, Peripheral

temp_uuid = UUID(0x2A19)

p = Peripheral("60:7C:9E:92:50:C1", "random")

try:
    ch = p.getCharacteristics(uuid=temp_uuid)[0]
    print binascii.b2a_hex(ch.read())
finally:
    p.disconnect()
```

## ST7789 DISPLAY

### 5.1 Display example

**Note:** I think you need to connect the 5V, just connecting the SWD cable (3.3V) is likely not enough to light up the leds While connecting 5V, do not connect 3.3V

The watch has background leds **for** the LCD.

They need to be on (LOW) to visualize the display.

```
replace the display sample with the one in this repo
$ cp (this repo)st7789 ~/zephyrproject/zephyr/samples/display
```

*building an image, which can be found under the build directory*

```
$ west build -p -b pinetime samples/display/st7789v
```

once the compilation is completed you can upload the firmware ~/zephyrproject/zephyr/build/zephyr/zephyr.bin  
if all goes well, you should see some coloured squares on your screen

## LITTLEVGL BASIC SAMPLE

### 6.1 Overview

This sample application displays “Hello World” in the center of the screen and a counter at the bottom which increments every second.

LittlevGL is a free and open-source graphics library providing everything you need to create embedded GUI with easy-to-use graphical elements, beautiful visual effects and low memory footprint.

### 6.2 Requirements

definitions can be found under the boards sub-directory

- pinetime.conf
- pinetime.overlay

The program has been modified to light up the background leds. Might be unnecessary... can be found in this repo

```
Matching labels are necessary!
pinetime.conf:CONFIG_LVGL_DISPLAY_DEV_NAME="DISPLAY"
pinetime.overlay:          label = "DISPLAY"; (spi definition)
```

### 6.3 Building and Running

Make sure you copied the board definitions.

```
west build -p -b pinetime samples/gui/lvgl
```

modifying the font size :

west build -t menuconfig goto additional libraries / lvgl gui library (look for fonts, and adapt according to your need)

west build

### 6.4 Todo

- Create a button
- touchscreen activation (problem cause zephyr does not support this yet)

- lvgl supports `lv_canvas_rotate(canvas, &imd_dsc, angle, x, y, pivot_x, pivot_y)` should be cool for a clock, chrono...

## 6.5 References

<https://docs.littlevgl.com/en/html/index.html>

LittlevGL Web Page: <https://littlevgl.com/>

## SERIAL NOR FLASH

```
west build -p -b pinetime samples/drivers/spi_flash -DCONF=prj.conf
```

### 7.1 Overview

This sample application should unlock the serial nor flash memory. This can be very usefull to store e.g. background for the watch.

compilation problematic ....

/root/zephyrproject/zephyr/samples/drivers/spi\_flash/src/main.c:17:22: error: 'DT\_INST\_0\_JEDEC\_SPI\_NOR\_LABEL' undeclared (first use in this function); did you mean 'DT\_INST\_0\_NORDIC\_NRF\_RTC\_LABEL'?

### 7.2 Requirements

complement the pinetime.dts file with the following (under spi)

```
mx25r64: mx25r6435f@0 {
    compatible = "spi-nor, jedec";
    reg = <0>;
    spi-max-frequency = <80000000>;
    label = "MX25R64";
    jedec-id = [c2 28 17];
    size = <67108864>;
    has-be32k;
    has-dpd;
    t-enter-dpd = <10000>;
    dpd-wakeup-sequence = <30000 20 45000>;
    wp-gpios = <&gpio0 5 0>;
    hold-gpios = <&gpio0 23 0>;
};

};
```

## 7.3 Building and Running

## 7.4 Todo

- detect ID memory
- create working board definition

## 7.5 References

<http://files.pine64.org/doc/datasheet/pinetime/MX25L6433F,%203V,%2064Mb,%20v1.6.pdf>

## SENSORS ON THE I2C BUS

0x18: Accelerometer: BMA423-DS000 <https://github.com/BoschSensortec/BMA423-Sensor-API>

0x44: Heart Rate Sensor: HRS3300\_Heart

0x15: Touch Controller: Hynitron CST816S Touch Controller

## CONFIGURING I2C

### 9.1 board level definitions

```
under boards/arm/pinetime are the board definitions
- pinetime.dts
- pinetime_defconfig
```

The sensors **in** the pintime use the I2C bus.

```
&i2c1 {
    compatible = "nordic,nrf-twi";
    status = "okay";
    sda-pin = <6>;
    scl-pin = <7>;

};
```

### 9.2 development trajectory

The final goal is to use the accel-sensor in the watch (BMA423), which does not exist yet. In order to minimize the effort:

- we'll use something that looks like it (ADXL372), because there exists an example.
- next we adapt it to use the existing BMA280 sensor (under drivers/sensor)
- finally we create a driver for the BMA423, based upon the BMA280

### 9.3 defining an I2C sensor

```
under samples/sensor/axl372 we create : "pinetime.overlay"
&i2c1 {
    status = "okay";
    clock-frequency = <I2C_BITRATE_STANDARD>;
    adxl372@18 {
        compatible = "adi,adxl372";
        reg = <0x18>;
        label = "ADXL372";
```

(continues on next page)

(continued from previous page)

```
        int1-gpios = <&gpio0 8 0>;  
    };  
};
```

**note:** this gets somehow merged with the board definition `pinetime.dts`

In the `"prj.conf"` file we define the sensor

```
CONFIG_STDOUT_CONSOLE=y  
CONFIG_LOG=y  
CONFIG_I2C=y  
CONFIG_SENSOR=y  
CONFIG_ADXL372=y  
CONFIG_ADXL372_I2C=y  
CONFIG_SENSOR_LOG_LEVEL_WRN=y
```

**note:** this gets somehow merged with the board definition `pinetime_defconfig`

## 9.4 compiling the sample

```
west build -p -b pinetime samples/sensor/adxl372 -DCONF=prj.conf
```

## BOSCH BMA280

```
west build -p -b pinetime samples/drivers/bma280
```

### 10.1 Overview

This sample application mimics the presence of a bosch, bma280 accel sensor. For this sensor exists a driver in zephyr, but no sample. Remember, I'm not a zephyr expert and am learning on the way.

### 10.2 Requirements

complement the pinetime.dts file with the following (under samples/sensor/bma280)

```
&i2c1 {
    bma280@18 {
        compatible = "bosch,bma280";
        reg = <0x18>;
        label = "BMA280";
        int1-gpios = <&gpio0 8 0>;
    };
};
```

Create a file: `/dts/bindings/sensor/bosch,bma280-i2c.yaml`. Which contains:

```
compatible: "bosch,bma280"
include: i2c-device.yaml
properties:
    int1-gpios:
        type: phandle-array
        required: false
```

### 10.3 Building and Running

### 10.4 Todo

- since no serial port and no J-LINK, I have to print messages to the screen or trough bluetooth serial (which does not exist, or I haven't found it yet ;))

## 10.5 References

## MENUCONFIG

### 11.1 Zephyr is like linux

**Note:** to get a feel, compile a program, for example

```
west build -p -b pinetime samples/bluetooth/peripheral -D CONF_FILE="prj.conf"
```

the pinetime contains an external 32Kz crystal now you can have a look in the configuration file (and modify if needed)

```
$ west build -t menuconfig
```

## HACKING THE PINETIME SMARTWATCH

The pinetime **is** preloaded **with** firmware.  
This firmware **is** secured, you cannot peek into it.

**Note:** The pinetime has a swd interface. To be able to write firmware, you need special hardware. I use a stm-link which is very cheap(2\$). You can also use the GPIO header of a raspberry pi. (my repo: <https://github.com/najnesnaj/openocd> is adapted for the orange pi)

To flash the software I use openocd : example for stm-link usb-stick

```
# openocd -s /usr/local/share/openocd/scripts -f interface/stlink.cfg -f target/nrf52.  
↪cfg
```

example for the orange-pi GPIO header (or raspberry)

```
# openocd -f /usr/local/share/openocd/scripts/interface/sysfsgpio-raspberrypi.cfg -c 'transport select swd'  
-f /usr/local/share/openocd/scripts/target/nrf52.cfg -c 'bindto 0.0.0.0'
```

once you started the openocd background server, you can connect to it using:

```
#telnet 127.0.0.1 4444
```

### programming

```
once your telnet sessions started:  
Trying 127.0.0.1...  
Connected to 127.0.0.1.  
Escape character is '^]'.  
Open On-Chip Debugger  
> program zephyr.bin  
  
target halted due to debug-request, current mode: Thread

wrote 24576 bytes from file zephyr.bin in 1.703540s (14.088 KiB/s)  
** Programming Finished **
```

(continues on next page)

(continued from previous page)

```
And finally execute a reset :  
>reset
```

removing write protection see: *[howto flash your zephyr image](#)*

## HOWTO FLASH YOUR ZEPHYR IMAGE

Once you completed your `west build`, your image is located under the build directory

```
$ cd ~/zephyrproject/zephyr/build/zephyr
here you can find zephyr.bin which you can flash
```

I have an orange pi (single board computer) in my network.

I copy the image using `$scp -P 8888 zephyr.bin 192.168.0.77:/usr/src/pinetime` (secure copy using my user defined port 8888 which is normally port 22)

---

**Note:** the PineTime watch is read/write protected executing the following : `nrf52.dap apreg 1 0x0c` shows 0x0

Mind you st-link does not allow you to execute that command, you need J-link. There is a workaround using the GPIO of a raspberry pi or a OrangePi. You have to reconfigure Openocd with the `–enable-cmsis-dap` option.

Unlock the chip by executing the command: `> nrf52.dap apreg 1 0x04 0x01`

---

## HOWTO GENERATE PDF DOCUMENTS

sphinx cannot generate pdf directly, and needs latex

```
apt-get install latexmk
apt-get install texlive-fonts-recommended
apt-get install xzdec
apt-get install cmap
apt-get install texlive-latex-recommended
apt-get install texlive-latex-extra
```
