```
this document describes the installation of zephyr RTOS on the PineTime smartwatch.

https://wiki.pine64.org/index.php/PineTime

It should be applicable on other nordic nrf52832 based watches (Desay D6....).
```

```
the approach in this manual is to get quick results:

- minimal effort install

- try out the samples

- inspire you to modify and enhance
```

### suggestion:

- install zephyr, https://docs.zephyrproject.org
- copy the board definition
- try some examples
- try out bluetooth
- try out the display

2 CONTENTS

**ONE** 

#### **ABOUT**

I got a pinetime development kit very early.

I would like to thank the folks from https://www.pine64.org/.

I like to hack stuff, and I like the idea behind Open Source.

The smartwatches I hacked, contained microcontrollers from Nordic Semiconductor.

A lot of resources exist for this breed.

It is an Arm based, 32bit microcontroller with a lot of flash and RAM memory.

In fact it is a small computer on your wrist, with a battery and screen, and capable of bluetooth 4+ wireless communication.

```
A word of warning: this is work in progress.
You're likely to have a better skillset then me.
You are invited to add the missing pieces and to improve what's already there.
```

### 1.1 Todo

list with suggestions:

- better graphics (lvgl using images and rotating stuff)
- NOR flash (here one can store data)
- · watchdog
- DFU (update over bluetooth)
- · acceleration sensor
- · heart rate sensor
- · fun stuff
- useless stuff, but somehow cool
- applications, e.g. calculator, cycle computer, step counter, heart attack predictor ...

#### 1.2 Fast track

In this repository you can find modified directories, which you can copy to the zephyrproject directory:

• pinetime (board definition -> boards/arm)

- st7789v (example -> samples/display)
- blinky (example -> samples/basic)

Chapter 1. About

**TWO** 

### **INSTALL ZEPHYR**

#### https://docs.zephyrproject.org/latest/getting\_started/index.html

the documentation describes an installation process under Ubuntu/macOS/Windows

I picked Debian (which is not listed) .... and soon afterwards ran into trouble

this behaviour is known as: stuborn or stupid, but I remain convinced it could work

But even after following the rules, I got a problem with the dtc (device tree compiler)

• I solved this by creating a link from the development-tools to /usr/bin/dtc (here you need to make sure you got a very recent one)

```
cd /root/zephyr-sdk-0.10.3/sysroots/x86_64-pokysdk-linux/usr/bin/mv dtc dtc-orig
ln -s /usr/bin/dtc dtc
```

#### Note: in order to get the display st7789 Picture-Perfect, you might need a zephyr patch

have a look at: https://github.com/zephyrproject-rtos/zephyr/pull/20570/files You will find them in this repo under patches-zephyr.

THREE

### ZEPHYR ON THE PINETIME SMARTWATCH

### 3.1 Blinky example

Note: I think you need to connect the 5V, just connecting the SWD cable (3.3V) is likely not enough to light up the leds

```
The watch does not contain a led as such, but it has background leds for the LCD.

Once lit, you can barely see it, cause the screen is black.
```

```
copy the board definition for the pinetime to the zephyrproject directory
$ cp (this repo)pinetime ~/zephyrproject/zephyr/boards/arm/pinetime
replace the blinky sample with the one in this repo
$ cp (this repo)blinky ~/zephyrproject/zephyr/samples/basic
```

have a look at the pinetime.dts file, here you see the definition of the background leds.

```
gpios = <&gpio0 14 GPIO_INT_ACTIVE_LOW>;
gpios = <&gpio0 22 GPIO_INT_ACTIVE_LOW>;
gpios = <&gpio0 23 GPIO_INT_ACTIVE_LOW>;
```

building an image, which can be found under the build directory

```
$ west build -p -b pinetime samples/basic/blinky
```

once the compilation is completed you can upload the firmware ~/zephyrproject/zephyr/build/zephyr/zephyr.bin

open source watch Documentation, Release 1.0.0
•

**FOUR** 

### **BLUETOOTH (BLE) EXAMPLE**

# 4.1 Eddy Stone

Note: compile the provided example, so a build directory gets created

```
$ west build -p -b pinetime samples/bluetooth/eddystone
```

this builds an image, which can be found under the build directory

I use linux with a bluetoothadapter 4.0. You need bluez.

```
#bluetoothct1
[bluetooth] #scan on
```

And your Eddy Stone should be visible.

If you have a smartphone, you can download the nrf utilities app from nordic.

# 4.2 Ble Peripheral

this example is a demo of the services under bluetooth

first build the image

```
$ west build -p -b pinetime samples/bluetooth/peripheral -D CONF_FILE="prj.conf"
```

the image, can be found under the build directory, and has to be flashed to the pinetime with linux you can have a look using bluetoothctl

```
#bluetoothctl
[bluetooth]#scan on

[NEW] Device 60:7C:9E:92:50:C1 Zephyr Peripheral Sample Long
once you see your device
[blueooth]#connect 60:7C:9E:92:50:C1 (the device mac address as displayed)
then you can already see the services
```

same thing with the app from nordic, you could try to connect and display value of e.g. heart rate

# 4.3 using Python to read out bluetoothservices

In this repo you will find a python script: readbat.py In order to use it you need bluez on linux and the python *bluepy* module.

It can be used in conjunction with the peripheral bluetooth demo. It just reads out the battery level, and prints it.

```
import binascii
from bluepy.btle import UUID, Peripheral

temp_uuid = UUID(0x2A19)

p = Peripheral("60:7C:9E:92:50:C1", "random")

try:
    ch = p.getCharacteristics(uuid=temp_uuid)[0]
    print binascii.b2a_hex(ch.read())

finally:
    p.disconnect()
```

**FIVE** 

#### ST7789 DISPLAY

# 5.1 Display example

Note: I think you need to connect the 5V, just connecting the SWD cable (3.3V) is likely not enough to light up the leds While connecting 5V, do not connect 3.3V

```
The watch has background leds for the LCD.

They need to be on (LOW) to visualize the display.
```

```
replace the display sample with the one in this repo

$ cp (this repo) st7789 ~/zephyrproject/zephyr/samples/display
```

building an image, which can be found under the build directory

```
$ west build -p -b pinetime samples/display/st7789v
```

once the compilation is completed you can upload the firmware ~/zephyrproject/zephyr/build/zephyr/zephyr.bin if all goes well, you should see some coloured squares on your screen

SIX

#### LITTLEVGL BASIC SAMPLE

#### 6.1 Overview

This sample application displays "Hello World" in the center of the screen and a counter at the bottom which increments every second.

LittlevGL is a free and open-source graphics library providing everything you need to create embedded GUI with easy-to-use graphical elements, beautiful visual effects and low memory footprint.

## 6.2 Requirements

definitions can be found under the boards sub-directory

- · pinetime.conf
- · pinetime.overlay

The program has been modified to light up the background leds. Might be unnecessary... can be found in this repo

```
Matching labels are necessary!
pinetime.conf:CONFIG_LVGL_DISPLAY_DEV_NAME="DISPLAY"
pinetime.overlay: label = "DISPLAY"; (spi definition)
```

### 6.3 Building and Running

Make sure you copied the board definitions.

```
west build -p -b pinetime samples/gui/lvgl
```

modifying the font size:

west build -t menuconfig goto additional libraries / lvgl gui library (look for fonts, and adapt according to your need) west build

#### 6.4 Todo

- · Create a button
- touchscreen activation (problem cause zephyr does not support this yet)

• lvgl supports lv\_canvas\_rotate(canvas, &imd\_dsc, angle, x, y, pivot\_x, pivot\_y) should be cool for a clock, chrono...

### 6.5 References

### **SEVEN**

# **SENSORS ON THE I2C BUS**

 $0x18:\ Accelerometer:\ BMA423-DS000\ https://github.com/BoschSensortec/BMA423-Sensor-API$ 

0x44: Heart Rate Sensor: HRS3300\_Heart

0x15: Touch Controller: Hynitron CST816S Touch Controller

**EIGHT** 

### **CONFIGURING 12C**

#### 8.1 board level definitions

```
under boards/arm/pinetime are the board definitions
- pinetime.dts
- pinetime_defconfig

The sensors in the pintime use the I2C bus.
&i2c1 {
        compatible = "nordic,nrf-twi";
        status = "okay";
        sda-pin = <6>;
        scl-pin = <7>;
        };
```

# 8.2 development trajectory

The final goal is to use the accel-sensor in the watch (BMA423), which does not exist yet. In order to minimize the effort:

- we'll use something that looks like it (ADXL372), because there exists an example.
- next we adapt it to use the existing BMA280 sensor (under drivers/sensor)
- finally we create a driver for the BMA423, based upon the BMA280

# 8.3 defining an I2C sensor

```
under samples/sensor/ax1372 we create : "pinetime.overlay"
&i2c1 {
    status = "okay";
    clock-frequency = <I2C_BITRATE_STANDARD>;
    adx1372@18 {
        compatible = "adi,adx1372";
        reg = <0x18>;
        label = "ADXL372";
```

(continues on next page)

(continued from previous page)

```
int1-gpios = <&gpio0 8 0>;
};
};
```

note: this gets somehow merged with the board definition pinetime.dts

```
In the "prj.conf" file we define the sensor

CONFIG_STDOUT_CONSOLE=y
CONFIG_LOG=y
CONFIG_12C=y
CONFIG_SENSOR=y
CONFIG_ADXL372=y
CONFIG_ADXL372_I2C=y
CONFIG_SENSOR_LOG_LEVEL_WRN=y
```

note: this gets somehow merged with the board definition pinetime\_defconfig

## 8.4 compiling the sample

```
west build -p -b pinetime samples/sensor/adx1372 -DCONF=prj.conf
```

NINE

#### **MENUCONFIG**

### 9.1 Zephyr is like linux

Note: to get a feel, compile a program, for example

```
west build -p -b pinetime samples/bluetooth/peripheral -D CONF_FILE="prj.conf"
```

the pinetime contains an external 32Kz crystal now you can have a look in the configurationfile (and modify if needed)

```
$ west build -t menuconfig
```

**TEN** 

#### HACKING THE PINETIME SMARTWATCH

```
The pinetime is preloaded with firmware.
This firmware is secured, you cannot peek into it.
```

**Note:** The pinetime has a swd interface. To be able to write firmware, you need special hardware. I use a stm-link which is very cheap(2\$). You can also use the GPIO header of a raspberry pi. (my repo: https://github.com/najnesnaj/openocd is adapted for the orange pi)

To flash the software I use openocd: example for stm-link usb-stick

```
# openocd -s /usr/local/share/openocd/scripts -f interface/stlink.cfg -f target/nrf52. \hookrightarrow cfg
```

example for the orange-pi GPIO header (or raspberry)

# openocd -f /usr/local/share/openocd/scripts/interface/sysfsgpio-raspberrypi.cfg -c 'transport select swd' -f /usr/local/share/openocd/scripts/target/nrf52.cfg -c 'bindto 0.0.0.0'

once you started the openocd background server, you can connect to it using:

```
#telnet 127.0.0.1 4444
```

#### programming

```
once your telnet sessions started:
Trying 127.0.0.1...
Connected to 127.0.0.1.
Escape character is '^]'.
Open On-Chip Debugger
> program zephyr.bin
target halted due to debug-request, current mode: Thread
xPSR: 0x01000000 pc: 0x00001534 msp: 0x20004a10
** Programming Started **
auto erase enabled
using fast async flash loader. This is currently supported
only with ST-Link and CMSIS-DAP. If you have issues, add
"set WORKAREASIZE 0" before sourcing nrf51.cfg/nrf52.cfg to disable it
target halted due to breakpoint, current mode: Thread
xPSR: 0x61000000 pc: 0x2000001e msp: 0x20004a10
wrote 24576 bytes from file zephyr.bin in 1.703540s (14.088 KiB/s)
** Programming Finished **
```

(continues on next page)

(continued from previous page)

And finally execute a reset :
>reset

removing write protection see: howto flash your zephyr image

#### **ELEVEN**

### **HOWTO FLASH YOUR ZEPHYR IMAGE**

Once you completed your west build, your image is located under the build directory

```
$ cd ~/zephyrproject/zephyr/build/zephyr
here you can find zephyr.bin which you can flash
```

I have an orange pi (single board computer) in my network.

I copy the image using \$scp -P 8888 zephyr.bin 192.168.0.77:/usr/src/pinetime (secure copy using my user defined port 8888 which is normally port 22)

Note: the PineTime watch is read/write protected executing the following: nrf52.dap apreg 1 0x0c shows 0x0

Mind you st-link does not allow you to execute that command, you need J-link. There is a workaround using the GPIO of a raspberry pi or a Orangepi. You have to reconfigure Openocd with the –enable-cmsis-dap option.

Unlock the chip by executing the command: > nrf52.dap apreg 1 0x04 0x01

open source watch Documentation, Release 1.0.0

### **TWELVE**

# **HOWTO GENERATE PDF DOCUMENTS**

#### sphinx cannot generate pdf directly, and needs latex

```
apt-get install latexmk
apt-get install texlive-fonts-recommended
apt-get install xzdec
apt-get install cmap
apt-get install texlive-latex-recommended
apt-get install texlive-latex-extra
```
